Building Reports, Dashboards, and Custom Pages (UI Builder) for the Event Management System in Zoho Creator

AIM

To design and build custom reports, an interactive dashboard, and a custom page using Zoho Creator's UI Builder for the **Event Registration & Participant Management** application, and carry out onboarding actions through purpose-built interfaces layered on top of the base **Event_Registration_Report**.

PROCEDURE

The organizing committee's information needs were first reviewed against the existing Event_Registration_Form data, identifying the need for track-filtered report views, an at-a-glance dashboard, and a single registration page combining charts, reports, and quick-access controls.

From the Reports panel, custom report views were created on top of Event_Registration_Form data: event_Registration_Report (a spreadsheet view listing every registered participant), Track_Wise_Registration_Report (a List/Chart view grouped by Event_Track and plotted against Team_Size to compare enrolment across tracks), and a Kanban-style board view grouping participant cards by Event_Track and Participant_Type. Each report's Criteria pane was used to set the relevant filter conditions, and the Columns option was used to hide fields not relevant to that view.

A new dashboard page, Event_Registration_Page, was then built using the Board Builder. Widgets were added and bound to the reports above: list widgets (Total Participants and Course/Type Completion) showing a running count of registrations by Event_Track and by Participant_Type, a Donut Chart widget (Event_Registration_Form) for track-wise share, a Column Chart widget for participant-type distribution, and a Line Chart widget plotting Preferred_Session_Slot. An embedded report table (Event_Registration_Form Report) and a "View All Participants" action button were placed beneath the charts so the front desk can drill through to the full participant list in one click.

Widgets were arranged with the list panels at the top, the Donut and Column charts side by side beneath them, the Line chart and embedded report following, and the drill-through button anchored at the bottom of the page.

Finally, the dashboard and its widgets were previewed to confirm that all counts, charts, and the embedded report rendered correctly against live registration data, the "View All Participants" button was tested end-to-end, and the application was published with edit access restricted to the organizing committee.

OUTPUT

241401011

The following screenshots capture the completed reporting layer: the Board Builder with widgets configured, the live front-desk dashboard, the Reports panel, and the Track_Wise_Registration_Report chart view.

RESULT

Thus, the Event Registration & Participant Management application was successfully enhanced with custom reports, filters, an interactive dashboard, and a Track_Wise_Registration_Report for analysing participant and team data. A “View All Participants” option was also added for quick access to complete registration details.
