1. Applications Dashboard

The Applications dashboard is the landing screen once inside Zoho Creator. It greets ANJAN ADITHYA NS by name and displays the workspace's existing application, "My first Creator app," created on Aug 03, 2026. The sidebar cleanly separates functions under Develop, Deploy, and Manage, making it simple to jump between building, publishing, and administering applications. A prominent "Create Application" button in the top-right corner encourages quick app creation.

2. Microservices Console

The Microservices section introduces a modular way to extend applications. A microservice is described as a modular app component that connects with third-party apps and helps build artificial intelligence features. Since none have been created yet, the page shows a friendly empty state with a "Create New" button, inviting users to start building reusable, connectable components for their solutions.

3. Multistage Environment Dashboard

The Environments page offers a multi-stage deployment space, split into "Stage" and "Production" columns, so applications can be tested safely before going live. With no applications added yet, the interface prompts the user to "Add Application," and controls like Version History, Manage, and Publish sit ready in the top-right corner for when deployment begins. The layout is calm, structured, and clearly built for controlled, professional release cycles.

4. Mobile App Deployment

The Mobile section explains how applications can be turned into rebranded, white-labelled mobile apps. On the trial plan, an upgrade is required to unlock features such as publishing to the Play Store and App Store, distributing through MDM or email links, and applying custom branding. Free, Zoho Creator-branded Android and iOS apps remain available even without upgrading, along with regional sales contact details for further assistance.

5. Portal Setup

The Portal page is described as an online, self-service gateway that lets customers and business partners interact directly with an application. As no portal has been created yet, the screen shows a simple empty state with a "Create New" call to action, keeping the path to building a customer-facing portal just one click away.

6. User Management and Role-Based Access

The Users section lists everyone with access to the account. ANJAN ADITHYA NS appears as the sole user, marked "SUPER ADMIN" with an "Active" status, alongside their registered email address. Search and filter tools sit in the top-right corner, and an "Add User" button makes it straightforward to extend access to a team through role-based permissions as the organization grows.

7. Organization Settings and Profile Setup

The Organization tab centralizes company branding and profile details. It allows uploading an organization logo and favicon, and displays Contact Information such as the organization name and address, Super Admin details including registered email and phone number, and Preferences like the organization namespace and time zone — here set to (GMT +05:30) Asia/Kolkata. Everything is editable, giving the workspace a consistent, professional identity.

8. Governance and Security Policies

The Governance page brings together the organization's security controls under four tabs: Security Policies, Custom Authentication, Active Directory, and Domains. The Security Policies tab, shown here, lets an admin configure password rules and multi-factor authentication to tighten access control across the organization, with a dedicated "Configure Security Policy" button to get started.

9. Metrics and Application Analysis Dashboard

The Metrics dashboard gathers insights, trends, and anomalies for user activity across applications. It tracks Applications Accessed, Idle Applications, Applications Hit Count, and the Daily Average Hits per Application, alongside Application Access Trend and Usage by Hit Count charts. Since the account is new, most figures read zero and "No data available," but the dashboard is fully set up to visualize usage the moment activity begins.

10. Operations and Centralized Management

The Operations page acts as a centralized control panel for managing the account. Under the Applications group alone it lists tools such as Backup, Audit Trail, Email Management, Domain Restriction, API Management, Blueprint Analytics, Logs, Publish, Form Email, Marketplace, Support Access, System Integrations, Zia, Payment Gateways, and Databridge — giving administrators one place to define and manage nearly every operational aspect of their Zoho Creator account.

11. Billing and Subscription Management

The Billing page provides a comprehensive view of the active subscription. It shows the trial ending in 8 days with an "Upgrade Now" prompt, along with Plan Details indicating 1 of 10 users and 1 of unlimited apps currently in use. A Usage Details section further highlights an improved dashboard for monitoring component usage, insights, and custom alerts, keeping subscription status and limits transparent at a glance.
